Acknowledgements: We would like to thank Linda Garris from the Bureau of Labor Statistics for the many tables of data she generated for us. Lisa Thomas did an outstanding job working with the BLS data, combining tables, reformatting, and adding confidence intervals, and then putting the document together. Angela Booth Jones created the carpal tunnel syndrome tables from tables downloaded from the Internet and provided extensive review and comment on the document. Thanks to Russell Estes for his assistance in formatting the tables. Appreciation is also extended to Pauline Elliott for layout and design of the document. Finally, this report would not have been possible without the support and consultation received from John Sestito, Assistant Director for Surveillance, and Lawrence J. Fine, Acting Director, National Institute for Occupational Safety and Health.

Introduction

In 1970 Congress passed the Occupational Safety and Health Act “to assure so far as possible every working man and woman in the Nation safe and healthful working conditions.” The National Institute for Occupational Safety and Health (NIOSH) was created to perform research concerning the causes of occupational injuries and illnesses. One responsibility of NIOSH is to identify occupational diseases and conditions in order to target research and prevention efforts. To meet this goal, surveillance of occupational health is a necessary first step. NIOSH uses a number of occupational health surveillance systems, some developed by NIOSH and others from outside agencies. One such external system is the annual Survey of Occupational Injuries and Illnesses (SOII), from the Bureau of Labor Statistics (BLS) in the Department of Labor. The SOII is the only national health surveillance system covering all types of illnesses and injuries caused by hazards in the workplace. NIOSH has used the SOII to target interventions to specific industries, for background information in NIOSH reports (NIOSH, 1997), and for descriptive reports on occupational disease (Burnett et al., 1998).

The purpose of this report is to provide descriptive information on six of the most common occupational illnesses or conditions in the United States: 1) musculoskeletal disorders of the back, 2) musculoskeletal disorders of the upper extremities, 3) musculoskeletal disorders of the lower extremities, 4) hernia, 5) dermatitis, and 6) anxiety, stress, and neurotic disorders. The SOII information presented here is not available from any other published or electronic source and can be obtained only by special request to BLS.

The rate of disorders due to repeated trauma reported in the SOII, mainly musculoskeletal disorders (MSDs), rose dramatically from 5.1/10,000 workers in 1984 to a high of 41.1/10,000 workers in 1994. Since 1994 the rate has decreased each year to a rate

of 32.0/10,000 in 1997. Numerous studies have been published debating the relationship between MSDs and work-related factors (NIOSH, 1997). MSDs include conditions due to repeated motion, vibration, or pressure, such as carpal tunnel syndrome; noise-induced hearing loss; synovitis, tenosynovitis, and bursitis, and Raynaud’s syndrome. Musculoskeletal disorders of the upper extremities and low back disorders are priority research areas in NIOSH’s National Occupational Research Agenda (NORA) (NIOSH, 1996). Surveillance data are necessary to determine the magnitude of the problem, the industries and occupations experiencing the highest rates, and the trends over time (Drudi, 1997).

Hernia is often reported in the SOII as a work-related condition, but debate continues on whether hernia could be caused or promoted by factors in the workplace and whether a person with a hernia should be restricted in work activities. An analysis of the 1994 BLS data provides information on this subject (Kang et al., 1999). The surveillance data presented here could be used to target further studies addressing these questions.

Dermatitis has long been one of the most common occupational illnesses. Allergic and irritant dermatitis is one of the NORA priority research areas. The surveillance data provides information on the industries with the highest rates and the causes of dermatitis within the industries, as well as an indication of the magnitude of the problem and the trend over time. A NIOSH analysis of the BLS data reported this information for 1993 (Burnett et al., 1998).

Anxiety, stress, and neurotic disorders thought to result from conditions in the workplace are reported in the SOII. Organization of work, which could lead to these disorders, is a NORA priority research area. A recent NIOSH document on stress at work (NIOSH, 1999) points out the dangers of stress. The

SOII data could be used to target studies in this important area. A recent presentation was based on the 1994 BLS data (Alterman et al., 1998).

This document gives an in-depth look at the SOII data, adding to its usefulness to occupational health researchers and others who use the data. It should increase awareness of the availability and value of these data to the occupational health community.

Background

Since 1972 the Bureau of the Labor Statistics (BLS) has conducted a survey on occupational injuries and illnesses. The amount of information originally collected was very limited. Starting in 1992 the survey was expanded to include descriptions of a sample of cases that result in one or more days away from work, giving demographic variables for each worker. This information has been used to target interventions and hazard evaluations, and to develop surveillance reports. The information routinely available in published documents or on the World Wide Web is restricted because of space considerations. To obtain more detailed information to develop reports or to target intervention activities, the National Institute for Occupational Safety and Health (NIOSH) commonly requests more specific data from BLS. This document presents the type of information that has been used by NIOSH, based on data for 1996.

Description of Data Source

The Annual Survey of Occupational Injuries and Illnesses is a BLS surveillance system that collects employer reports from private industry establishments each year (BLS, 1998), including about 165,000 establishments in 1996 (BLS, 1997). A two-stage selection process is used to produce the survey estimates. The first stage of the survey has been conducted since 1972. Selection of establishments is based on a scientifically selected probability sample of the universe of establishments. Comparable occupational injury and illness data for coal, metal, and nonmetal mining and for railroad activities are provided by the

Department of Labor's Mine Safety and Health Administration and the Department of Transportation's Federal Railroad Administration. Excluded from the survey are the self-employed, farms with fewer than 11 employees, private households, and federal, state, and local government agencies. Information on the number of workers and the number of work-related injuries and illnesses provided to the BLS is collected on the Log and Summary of Occupational Injuries and Illnesses (OSHA No. 200) kept by each establishment. The illness categories may change with anticipated changes in the OSHA recordkeeping rule and ergonomics standard. From the survey results, estimates are projected to private industry. Injury is a single category. Illnesses are divided into seven broad categories: skin diseases or disorders, dust diseases of the lungs, respiratory conditions due to toxic agents, poisoning, disorders due to physical agents, disorders associated with repeated trauma, and all other occupational illnesses (see Appendix for Glossary.) These data are called the summary data.

Prior to 1992, this information was used to identify industries with high rates of injuries and illness, but gave no information on the occupations at high risk or on the risks themselves. In 1992, the survey was redesigned with a second stage to collect descriptive information on a sample of the cases derived from the selected establishments that result in at least one day away from work. Establishments are instructed to take this information from workers' compensation reports, insurance forms, or other supplementary records. These data are called the case and demographic data. Again, using the results, estimates are projected to private industry. The descriptive information includes the personal characteristics of industry, occupation, race/ethnicity, sex, age, and length of employment. The injury or illness is characterized by information on the nature of injury or illness; the part of body affected; the event that produced the injury or illness; and the exposure source (the object, substance, bodily motion, or other exposure) that directly produced the injury or illness. The number of days away from work is used as a surrogate for the severity of the case.

Industry is coded by using the 1987 Standard Industrial Classification Manual (SIC) (Office of Management and Budget, 1987) and occupation from the 1990 Bureau of the Census (BOC) classification system (U.S. Bureau of the Census, 1982). For manufacturing industries, information is available at the 4-digit SIC level. For all other industries, the most detailed level is 3-digit SIC. The nature of the injury or illness, the part of body affected, the exposure source of injury or illness, and the event are coded according to the Occupational Injury and Illness Classification Structure (OIICS) developed by BLS (BLS, 1992). This system provides coding at four levels, from 1-digit to 4-digit, although not all categories can be expanded to the 4-digit level.

The complex statistical design of the Annual Survey required BLS to design special computer software to calculate estimates and variances. Estimates not meeting publication guidelines as determined by BLS, such as estimates based on an industry with fewer than three companies, are not reported (BLS, 1998, p. 332).

For the 1972 through 1996 data, BLS has disseminated the summary data either in a BLS publication or on the Internet. Information is available on the number and rates of all injuries and the seven illness categories by industry. The categories of all injuries and all illnesses are broken out by cases without lost workdays, lost

workday cases involving restricted work activity, and cases with days away from work (see Appendix for Glossary). Selected information is available by number of employees.

Tables 1 through 4 show the type of data available from the first stage of the survey. **Table 1** gives the numbers of cases and rates for illnesses for 1982-1996. While the number of cases and the rates increased slightly for most of the illnesses over this time period, disorders associated with repeated trauma increased nearly 10-fold. The illness information is also available by industry, as in **Tables 2 to 4**. The number of cases and rates by broad industry categories are shown in Table 2. Over half the cases occur in the manufacturing industry, and manufacturing has the highest rate of illnesses. Table 3 presents the number and rate of disorders associated with repeated trauma for top ten industries with more than 1000 cases, ranked by rate. Meat packing plants have the highest rate and the motor vehicles and car bodies industry has the most cases. The top ten industries with more than 100 cases of skin diseases or disorders are shown in Table 4. The ball and roller bearings industry has the highest rate and motor vehicle parts and accessories have the most cases. Although not shown, the injury and illness data (not broken out by illness conditions) are available according to lost workday cases or cases without lost workdays by industry. Until 1992 this was the extent of the data.

The case and demographic data from 1992 through 1996 are available on the Web in 2-way tables at <http://stats.bls.gov/oshhome.htm>. Each variable at the greatest classification detail is crossed with all other variables classified by broad categories. Numbers of cases, and where available, rates are given. Rates are not available for occupations or for demographic variables.

The following tables show the type of information available in the standard BLS tables. Demographic information on the cases of injury (traumatic injuries and disorders) and illness (systemic diseases and disorders) reported in 1996 is shown in *table 5*. Sex, race, age, and length of service for the injured or ill workers by detailed industry, occupation, source, body part, and event are available on the Web. Race

Table 5. Number and percent of injuries and illnesses involving days away from work by sex, race, age, and length of service, 1996

Characteristic	Workforce Composition	Total cases	Total percent of cases	Traumatic injuries & disorders	Systemic diseases & disorders
Sex					
Men	58,121,000	1,240,018	65.9	67.1	57.1
Women	49,916,000	620,508	33.0	32.0	42.2

*Data not included

and length of service are optional items in the survey. Race was not reported for about 27% of the cases and length of service was not reported for about 11%. Age and sex, which are mandatory, were not reported for fewer than 3% of the cases. Men constitute about two-thirds of the cases, with a larger percentage within the injury category than the illness. Non-Hispanic Whites comprise 73% of those with a reported race. Hispanics slightly outnumber non-Hispanic Blacks. Over half the injuries and illnesses occur in the 25 to 44 age range. About one-third of the cases have been with the employer for one to five years, with the illness cases having a longer length of service.

Table 6 presents selected natures (types) of injury or illness by major industry groups. The injury and ill-

ness natures shown are those included under conditions that are the focus of the next section of this report: musculoskeletal conditions caused by overexertion and repetitive motion, i.e., ergonomic factors; hernia; dermatitis; anxiety, stress, and neurotic disorders. Of these selected natures, sprains, strains, and tears have by far the most cases. Musculoskeletal system and connective tissue diseases and disorders have the most cases in the systemic diseases and disorders category. Manufacturing is the industry division with the largest number of cases, followed closely by services, which includes such industries as hotels, personal services, automotive repair services, amusement and recreation services, health services, legal services, and educational services.

*Date not available.

Table 7 presents the same natures of injury or illness by major occupation groups. Operators, fabricators, and laborers have the most cases, followed by precision production, craft, and repair occupations.

Table 8 gives the median days away from work (DAFW) and percent of cases having more than 20 DAFW for the selected natures of injury or illness. Carpal tunnel has the largest median days away from work with 25, followed by hernia with 24 days. Over 50% of the cases for these two conditions have over 20 days away from work.

Tables 9 and 10 show the illnesses and conditions resulting from overexertion and repetitive motion (ergonomic risk factors) by major industries and occupations. The services industry has the largest number of cases caused by overexertion and is second in the number of repetitive motion cases. Manufacturing ranks second for overexertion and has the largest number of repetitive motion cases. Transportation and public utilities has the highest rate for overexertion. Manufacturing has the highest rate of repetitive motion cases. Operators, fabricators, and laborers have the most cases due to overexertion, followed by service occupations. Operators, fabricators, and laborers also have the most repetitive motion cases, followed by technical, sales, and administrative support occupations.

Methods

While the tables published or made available on the Web by BLS furnish a great deal of information on occupational illnesses and conditions, they don't provide the detail needed to inform targeted research and intervention activities. To provide more specific information, BLS does special data tabulations on request. Using the 1996 data provided by BLS in response to our requests for information, we constructed tables

for musculoskeletal disorders of the back, upper extremities (including shoulder), and lower extremities. In addition to the musculoskeletal tables, tables for hernia, dermatitis, and anxiety, stress, and neurotic disorders were constructed. We also included information on carpal tunnel syndrome, which is available from the Web.

It is not possible to use the nature of injury and illness classification system given by the SOII survey to identify musculoskeletal conditions resulting from ergonomic risk factors. Musculoskeletal conditions are coded to several different nature of injury or illness categories: musculoskeletal system and connective tissue diseases and disorders; sprains, strains, and tears; back pain, hurt back; soreness, pain, hurt, except the back; and other less specific categories. Many of the cases included in these categories may result from traumatic injuries. A preferable way to identify the ergonomically related cases appears to be to use the event categories (the event or exposure that led to the condition) of overexertion and repetitive motion. Web tables with the nature of injury or illness by major events or exposures show that at least 95% of overexertion and repetitive motion cases are musculoskeletal in nature.

Table 11 shows the subcategories included within these broad event categories of overexertion and repetitive motion. We used these events for three body parts: back (all areas), upper extremities (including shoulder), and lower extremities (all areas). Carpal tunnel syndrome, a subset of upper extremity disorders, is a specific nature of injury or illnesses category reported by BLS in the standard tables on the Web. When the source of the condition is bodily motion or position of the worker in cases defined as ergonomically related, the event is repetitive motion. For all other sources the event is overexertion, usually in lifting.

Results

Table 12 shows the demographic distribution, including sex, race/ethnicity, age, and length of service, of the seven conditions and illnesses. The musculoskeletal conditions are most prevalent. Rates for all illnesses are low. Of the rates for illnesses, those for dermatitis and anxiety, stress, and neurotic conditions are among the highest. Unfortunately BLS is unable to combine years of data to provide more descriptive information for rarer conditions and illnesses.

A total of 600,390 musculoskeletal injury and illness cases were reported to be caused by overexertion and repetitive motion in 1996. The majority of these occurred in the back (52.2%) (*See figure*). The trunk, except back, had 10.8% of the cases. The upper extremity cases accounted for 26.0%, followed by the lower extremity cases with 3.7%. The neck accounted for 2.1% of the cases and all other and multiple sites had 5.3%. We selected the back, upper extremities, and lower extremities for further analyses. The trunk, except back, includes many hernia cases, which is

one of the conditions reported later in the document. Twenty-eight percent of the cases attributed to overexertion and repetitive motion had more than 20 days away from work.

Back

There were 312,994 cases of musculoskeletal disorders of the back reported, having a rate of 37.25/10,000 workers and a median of five DAFW. **Table 13** shows back conditions according to industry by number of cases, rate, and DAFW. Rates range from a low of 1.22/10,000 for the passenger transportation arrangement industry to a high of

213.68/10,000 for the scheduled air transportation industry. Nursing and personal care facilities and hospitals have the most cases, with 25,525 and 24,534, respectively. The industry with the highest median days away from work is anthracite mining, having 67, based on 11 cases. The top ten manufacturing industries and nonmanufacturing industries, having more than 500 cases, are shown in **table 14**. The most common event leading to musculoskeletal disorders of the

back is overexertion in lifting (not shown). **Table 15** shows the top industries and sources of overexertion in lifting leading to back conditions. The information from these tables can be used to identify the industries with the greatest problems. For instance, scheduled air transportation had the highest rate and also one of the largest number of cases. Within the industry, the highest rates were for the lifting of packages and parcels and boxes, cartons, and crates. Nursing homes have the largest number of cases and also a

high rate. The highest rate in this industry was for the lifting of health care patients. Trucking and courier services, except air, (SIC 421, **Table 13**) also having high rates, had a median of eleven DAFW, indicating that the injuries may be more severe than in most industries. This industry had 78 different sources of injury, with the highest two rates for boxes, crates, and cartons and cooling and humidifying machinery and appliances.

*Rate over 25/10,000 and more than 200 cases

Table 16 shows the number of cases and DAFW for musculoskeletal disorders of the back by occupation. Rates are not available for occupations since BLS does not collect information on the number of workers at an establishment in each occupation. **Table 17** shows the 20 occupations with the most cases. Nursing aides and orderlies experienced the most cases (33,578), followed by truck drivers (26,228), and nonconstruction laborers (20,196). For occupations with over 1,000 cases, miscellaneous food preparation workers had the highest median DAFW of 12, followed by technicians not elsewhere classified, farm workers, and construction supervisors having a median of 10 DAFW.

Upper Extremities

There were 156,100 cases of musculoskeletal disorders of the upper extremities reported, with a rate of 18.58/10,000 workers, and a median DAFW of 10. The major sites of the conditions were the wrist (6.72/10,000), shoulder (6.47/10,000), unspecified part of arm (1.15/10,000), and elbows (1.06/10,000). **Table 18** shows upper extremity conditions according to industry by number of cases, rate, and DAFW. Savings institutions (SIC=603) had the lowest rate of 1.58/10,000 worker. The flour and other grain mill products industry had the highest rate of 120.06/10,000 workers. Hospitals had 9,117 cases and a rate of 30.9 per 10,000 workers. The management and public relations industry had a median of 175 days away from work, based on 720 cases. The top ten manufacturing industries and top ten nonmanufacturing industries, having more than 500 cases, are shown in **table 19**. The source of bodily motion or position of injured worker is the most common for the upper extremity conditions. The industries having the highest rates of conditions caused by this source are shown in **table 20**. In **table 19**, the motor vehicle and car body manufacturing industry and the scheduled air transportation industry have both high rates and large numbers of cases. For the motor vehicle and car body industry, the main source of the condition was the bodily motion or position of the worker. For air transportation, the largest source was packages

and parcels, followed by boxes, crates, and cartons (Not shown in a table).

Table 21 shows the number of cases and days away from work by occupation. **Table 22** shows the 20 occupations having the most cases. Nursing aides and orderlies have the most cases, followed by nonconstruction laborers, assemblers, and truck drivers. The median DAFW for hand packers and packagers with a Bureau of Census (BOC) Code = 888 is four times that of private industry, having a median of 40 DAFW. Cooks (BOC=436), plumbers and pipefitters (BOC=585), have over twice that of private industry (data not shown).

Carpal Tunnel Syndrome

All the information on carpal tunnel syndrome is taken from the Web. Relative standard errors are not included, so it is not possible to calculate confidence intervals.

There were 29,937 carpal tunnel syndrome cases, with a rate of 3.60/10,000 workers and a median DAFW of 25. The source of carpal tunnel syndrome is always the bodily motion or position of the injured worker. The event that causes the condition is almost always repetitive motion. Under repetitive motion, unspecified repetitive motion accounted for 27.4% of the cases; typing or keyentry for 21.3%; repetitive use of tools for 12.0%; repetitive placing, grasping, or moving objects, except tools, for 26.8%; and repetitive motion, not elsewhere classified, for 12.4%.

Table 23 shows carpal tunnel syndrome cases according to industry by rate and number of cases. The top ten manufacturing industries and top seven nonmanufacturing industries, having more than 100 cases, are shown in **table 24**. Those with high rates and the most cases are health and allied services, nec, motor vehicle and car body manufacturing, and motor vehicle parts and accessories manufacturing.

Table 25 shows occupations by the number of cases. **Table 26** shows the twelve occupations having the most cases. Most of the top occupations are those one would expect: assemblers, machine operators, users of computers, etc.

Lower Extremities

There were 22,229 cases of musculoskeletal disorders of the lower extremities reported, with a rate of 2.65/10,000 workers and a median DAFW of eight. The major sites of the condition were the knee (1.42/10,000), leg other than the knee (0.68/10,000), and ankle (0.33/10,000). **Table 27** shows lower extremity conditions according to industry by number of cases, rate, and DAFW. The top manufacturing industries and top ten nonmanufacturing industries,

having more than 50 cases, are shown in **table 28**. The top industries and sources in those industries leading to musculoskeletal disorders are shown in **table 29**. The top three industries, in terms of both number of cases and rate, were scheduled air transportation, nursing and personal care facilities, and hospitals. The most important source of the condition for both nursing and personal care facilities and hospitals was health care patients. For air transportation, packages and parcels and boxes, crates, and cartons were the top sources.

Table 30 shows the number of cases and DAFW for musculoskeletal disorders of the lower extremities by occupation. **Table 31** shows the occupations with the most cases of musculoskeletal disorders. Four occupations experienced over 1,000 cases: miscellaneous food preparation workers, nursing aides and orderlies, truck drivers, and freight, stock, and material handlers, not elsewhere classified.

Hernia

There were 29,624 cases of hernia causing at least one day away from work in 1996, with a rate of 3.5/10,000 workers. The median DAFW was 24. Most of the cases, 27,928, occurred in males. **Table 32** shows number of cases and DAFW by industry for males. Rates are not available for an industry breakdown by sex. In a publication on hernia using the 1994 data (Kang, 1999), rates were computed for males by major industry sector using data from the 1994 Current Population Survey for the population at risk. This is shown in **table 33**. Wholesale trade industry had the highest rate, followed by manufacturing and construction industries.

The number of cases and days away from work by occupation are shown in **table 34**. Truck drivers, nonconstruction laborers, and freight, stock, and material handlers, each have over 1,000 cases of hernia.

Table 35 shows the number of cases, DAFW by major occupational group. Handlers, equipment cleaners, helpers and laborers had the highest number of cases. **Table 36** shows the eighteen occupations at the highest risks as computed using the 1994 BLS data and the Current Population Survey. Nonconstruction laborers had the highest risk, followed by miscellaneous machine operators.

Table 37 shows the events that led up to the reported hernia cases. Sixty percent of the cases were due to overexertion in lifting. Other types of overexertion accounted for another 27% of the cases.

Dermatitis

There were 6,884 cases of dermatitis causing at least one day away from work in 1996, with a rate of 0.8/10,000 workers and a median DAFW of 3.

Table 38 shows the number of cases, rate, and DAFW for dermatitis by industry at the 3-digit SIC level. In **table 39**, the top industries, having at least 50 cases and a rate above 1.5, are shown by manufacturing and nonmanufacturing. Several service industries have high rates and large numbers of cases: landscape and horticultural services, services to buildings, and nursing and personal care facilities. **Table 40** lists the sources of dermatitis by the number of cases and the median days away from work. Cleaning and polishing agents caused the most cases, followed by exposure to poison ivy, oak, and sumac. Adhesives and glues caused the most days away from work, having a median of 67 days. Sources of dermatitis within broad industry categories are shown in **table 41**. Other than the non-classifiable sources, clothing and shoes in the health services industry caused the most cases. This category includes latex gloves.

Table 42 shows the number of dermatitis cases and days away from work by occupation. The occupations having more than 50 cases are shown in **table 43**. Nursing aides and orderlies and janitors and cleaners are the two occupations with the most cases. Miscellaneous food preparation workers have the most days away from work, with a median of 10 days.

Anxiety, Stress, and Neurotic Disorders

There were an estimated 5,561 cases of anxiety, stress, and neurotic disorders reported in 1996, with a rate of 0.7 per 10,000 workers and a median of 11 days away from work. Thirty percent of the cases occurred in the services industry, having a rate of 0.7; 15% in retail trade, having a rate of 0.9; 16% in manufacturing, having a rate of 0.5; and 15% in finance, insurance, and real estate, having a rate of 1.4. **Table 44** presents the number of cases and days away from work by industry for females and males, separately. When presenting the industries by sex, it is not possible to compute rates. The DAFW vary widely within the industries. **Table 45** shows the event that led to the disorder. Bodily conditions, nec (that is, other than bodily reaction, overexertion, repetitive motion, and sustained

viewing; heart attack and stroke are included in this category) led to the largest number of cases for both men and women. Exposure to traumatic or stressful event, nec (includes instances where workers are made ill by stressful events on the job or by witnessing accidents or other traumatic events) was second most common for both sexes. The number of cases by

major occupation categories is shown in *table 46*. Women in administrative support occupations reported the most cases, while the most cases for men were seen in sales occupations. Looking at detailed occupations (*Table 47*) shows that supervisors and proprietors in sales occupations reported the most cases for both men and women.

Discussion

This document has summarized data from the 1996 annual Bureau of Labor Statistics Survey of Occupational Injuries and Illnesses to define the magnitude of selected worker health problems and to identify populations at risk by examining case patterns by industry, occupation, and demographic and exposure groups. By presenting more detailed descriptive information about the workplace factors from which these cases arise, we hope to stimulate targeted intervention efforts and, as necessary, to spawn more detailed surveillance initiatives within high-risk segments.

A disproportionate number of musculoskeletal disorder cases caused by overexertion and repetitive motion were found to occur for the back (52%). Twenty-six percent occurred in the upper extremities (including the shoulder) and 4% in the lower extremities. The industries, occupations, and exposure sources associated with the highest rates of musculoskeletal disorders arising from overexertion and repetitive motion are identified in this report for each of these three regions of the body. The exposure sources "health care patient" and "boxes, crates and cartons," presumably during manual handling procedures, accounted for the majority of back cases. Nursing aids/orderlies, truck drivers, nonconstruction

laborers, and freight/stock/materials handlers were the occupational groups having the highest number of back cases. The exposure source "bodily motion" accounted for the majority of upper extremity cases among segments of the apparel, food processing, automotive, wood products, and electric equipment industries. Nursing aids/orderlies, nonconstruction laborers, assemblers, and truck drivers were the occupational groups having the highest number of upper extremity cases. Assemblers, machine operators, cashiers and secretaries were included among the occupational groups having the highest number of carpal tunnel syndrome cases. For the lower extremities, "health care patient" was an exposure source that accounted for a large proportion of cases.

The lists of the top industry sectors associated with the highest rates of musculoskeletal cases contained within this report are different from the lists published by BLS to identify the top 25 industries having the highest rates of disorders associated with repeated trauma. There are a number of reasons for these differences: First, the category of disorders associated with repeated trauma is a health condition collected only in the first stage of the survey, which reports all injuries and illnesses. In this document, disorders produced by repetitive motion and by overexertion, outcomes found only in the second stage of the survey describing cases with at least one day away from work, were combined to identify musculoskeletal cases by body region. Repetitive motion is contained within the disorders associated with repeated trauma health condition, along with other conditions. Cases due to overexertion should not be reported as disorders associated with repeated trauma. Secondly, the industry lists contained in this document were generated by region of body where the case condition developed. It is not possible to identify the body region in the repeated trauma cases. Thirdly, to identify industries most in need of intervention programs, i.e., those with both the highest rates and the most cases, we required a minimum number of cases for inclusion in the lists generated. Finally, whereas the BLS list does not distinguish manufacturing and other

sectors, in this document we sought to identify the top industry groups within both the manufacturing and nonmanufacturing sectors. Despite these differences, many of the industries having high rates of repeated trauma disorders are included in the lists of industries in this report.

The case and demographic data collected by BLS are obtained only for a sample of cases resulting in at least one day away from work. Days away from work is often used as a marker of severity of occupational health conditions. Median days away from work due to musculoskeletal disorders were found to vary greatly by industry and occupational group. In addition to severity or degree of functional impairment, other factors can potentially influence the number of days away from work, such as the availability of restricted duty assignments, the feasibility of job modifications (or accommodations), and medical management practices within work sites (GAO, 1997). It is possible that industry sectors having worksite ergonomic programs or other human resource practices that reduce lost work time would not be fully represented in the data summaries presented in this document. In addition, contingent workers (i.e., "temps," and seasonal) are most likely not adequately represented in the Bureau of Labor Statistics data set used to compile these descriptive summaries.

Hernia is a defect of the anterior/inferior abdominal cavity. Obesity, advanced age, and heavy lifting have been reported as causes. Authorities do not agree that occupation is a factor in the development or aggravation of hernia (Kang, 1999). Despite this, hernia is frequently reported in the BLS survey of work-related conditions. It is a major cause of days away from work, with a median of 24 days, compared to a median of five for all injuries and illnesses. Truck drivers; nonconstruction laborers; miscellaneous freight, stock, and material handlers; and miscellaneous machine operators have the largest number of cases. Overexertion in lifting is the most frequently reported cause. Men who develop hernias while engaged in

jobs involving lifting or other strenuous activities are probably more likely to have the hernia reported as work-related than men in sedentary jobs.

Skin diseases and disorders rank in number of cases after diseases and disorders of the nervous system and sense organs (mostly carpal tunnel syndrome), the musculoskeletal system and connective tissue, and the digestive system (mostly hernia), and, since the beginning of the survey in 1972, have been among the most common illnesses reported. Nursing aides/orderlies, janitors and cleaners, miscellaneous machine operators, and workers in the wholesale trade of mining and manufacturing report the most cases of dermatitis. Cleaning and polishing agents are the most common source, followed by unspecified chemicals and poison ivy, oak, or sumac. From other surveys we know that work-related dermatitis is underreported. A national household survey in 1988 with self-reported work-related dermatitis estimated 1.7 cases/100 workers (Behrens et al., 1994), compared with the BLS estimate of 0.8 cases/10,000 workers. The survey also found that few people reported the dermatitis to their employers as related to an exposure at work (Burnett, 1998).

More women than men report anxiety, stress, and neurotic disorders. For women the most cases were in administrative support occupations while for men the occupational group with the most cases was sales occupations. For both men and women, bodily condi-

tions, such as heart attack and stroke caused the most cases, followed by exposure to traumatic or stressful events. Although the reporting of anxiety, stress, and neurotic disorders has increased in recent years, they are probably underreported (Hurrell and Murphy, 1992). In the state workers' compensation systems, the definition of disorders of this nature varies from state to state. Psychological disorders arise from interactions among biological, psychological, and social factors. It is difficult to attribute a specific cause, such as a workplace exposure, to these cases. The impact of these disorders is great, both in terms of monetary cost and of effect on the life of the worker and his/her family, and there is a need to better understand the relationship of workplace stresses and outside factors.

Under Reporting

The data summaries contained in this document provide detailed information about workplace factors associated with case status for six of the most common occupational health problems in the United States. Musculoskeletal disorders are defined in a manner not available from BLS documents or Web tables. The tables give examples of the types of cross tabulations that can be done with these data. This detailed information should be useful to occupational health researchers as background information and to stimulate new research. The information will also be useful to policy makers, unions, and companies to see where problems lie, and what the causes may be.

Appendices

List of tables

1. Number and rate of occupational illnesses by category of illness, private industry, 1982-1996
2. Number and rate of occupational illnesses by industry division and illness category, private industry, 1996
3. Top ten industries for disorders associated with repeated trauma: industries having more than 1000 cases, 1996
4. Top ten industries for skin diseases or disorders: industries having more than 100 cases
5. Number and percent of injuries and illnesses involving days away from work by sex, race, age, and length of service, 1996
6. Number of occupational illnesses and conditions involving days away from work by selected natures of illness or condition and industry division, 1996
7. Number of occupational illnesses and conditions involving days away from work by selected nature of illness or condition and occupational summary groups, 1996
8. Median days away from work (DAFW) for selected nature of illness or condition, 1996
9. Number and rate of occupational illnesses and conditions by DAFW by industry and event or exposure leading to illness or condition, 1996
10. Number of occupational illnesses and injuries by DAFW by causal event or exposure and summary occupational groups, 1996
11. Subcategories included in the event categories of overexertion and repetitive motion
12. Number of cases for demographic characteristics: selected conditions and illnesses, 1996
13. Number of cases, rate, and median days away from work for musculoskeletal disorders of the back by industry, 1996
14. Top 10 manufacturing and nonmanufacturing industries for musculoskeletal disorders of the back, 1996
15. Top industries and sources of musculoskeletal disorders of the back caused by lifting, 1996
16. Number of cases, days away from work for musculoskeletal disorders of the back by occupation, 1996
17. Top 20 occupations with musculoskeletal disorders of the back
18. Number of cases, rate, and days away from work for musculoskeletal disorders of the upper extremities by industry, 1996
19. Top 10 manufacturing and nonmanufacturing industries for musculoskeletal disorders of the upper extremities, 1996
20. Top industries with bodily motion as the source of musculoskeletal disorders of the upper extremities, 1996
21. Number of cases, median days away from work for musculoskeletal disorders of the upper extremities by occupation, 1996
22. Top 20 occupations with musculoskeletal disorders of the upper extremities
23. Rates and counts for carpal tunnel syndrome by industry, 1996
24. Top manufacturing and nonmanufacturing industries for carpal tunnel syndrome, 1996.
25. Number of cases for carpal tunnel syndrome by occupation, 1996
26. Occupations with more than 500 cases of carpal tunnel syndrome, 1996
27. Number of cases, rates, and median days away from work for musculoskeletal disorders of the lower extremities by industry, 1996
28. Top manufacturing and nonmanufacturing industries for musculoskeletal disorders of the lower extremities, 1996

29. Top industries and sources of musculoskeletal disorders of the lower extremities, 1996
30. Number of cases, median days away from work for musculoskeletal disorders of the lower extremities by occupation, 1996
31. Top 10 occupations with musculoskeletal disorders of the lower extremities
32. Number of cases, median days away from work for hernia in males by industry, 1996
33. Incidence rate (IR) of hernia by industry in males, 1994
34. Number of cases, median days away from work for hernia in males by occupation, 1996
35. Number of cases, median days away from work for hernia in males by major occupation, 1996
36. The top 18 occupations for hernia in males, 1996
37. Number of cases, median days away from work for hernia in males by causal event, 1996
38. Number of cases, rates, and days away from work for dermatitis by industry, 1996
39. Top manufacturing and nonmanufacturing industries by rate for dermatitis, 1996
40. Number of cases, days away from work for dermatitis by source, 1996
41. Number of cases, days away from work for industries by source of dermatitis, 1996
42. Number of cases, days away from work for dermatitis by occupation, 1996
43. Occupations with more than 50 cases of dermatitis, 1996
44. Number of cases, days away from work for anxiety, stress, and neurotic disorders by sex and industry, 1996
45. Number of cases, days away from work for events that resulted in anxiety, stress, and neurotic disorders, by sex, 1996
46. Number of cases, days away from work for anxiety, stress, and neurotic disorders by sex and major occupation categories, 1996
47. Number of cases, days away from work for anxiety, stress, and neurotic disorders by sex and detailed occupation, 1996

Glossary of Terms

Lost workday cases: are cases which involve days away from work, or days of restricted work activity, or both.

Lost workday cases involving days away from work: are those cases which result in days away from work, or a combination of days away from work and days of restricted work activity.

Lost workday cases involving restricted work activity: are those cases which result in restricted work activity only.

Occupational skin diseases or disorders: includes contact dermatitis, eczema, or rash caused by primary irritants and sensitizers or poisonous plants; oil acne; chrome ulcers; chemical burns or inflammations.

Dust diseases of the lungs (pneumoconiosis): include silicosis, asbestosis and other asbestos-related diseases, coal worker's pneumoconiosis, byssinosis, siderosis, and other pneumoconioses.

Respiratory condition due to toxic agents: illnesses in this category would include pneumonitis, pharyngitis, rhinitis or acute congestion due to chemicals, dusts, gases, or fumes; farmer's lung.

Poisoning: includes poisoning caused by lead, mercury, cadmium, arsenic, or other metals; poisoning by carbon monoxide, hydrogen sulfide, or other gases; poisoning by benzol, carbon tetrachloride, or other organic solvents; poisoning by insecticide sprays such as parathion and lead arsenate; poisoning by other chemicals such as formaldehyde, plastics, and resins.

Disorders due to physical agents: would encompass conditions caused by heatstroke, sunstroke, heat exhaustion, and other effects of environmental heat; freezing, frostbite, and effects of ionizing radiation (isotopes, X-rays, radium); effects of non-ionizing radiation (welding flash, ultraviolet rays, microwaves, sunburn).

Disorders associated with repeated trauma: includes conditions due to repeated motion, vibration, or pressure, such as carpal tunnel syndrome; noise-induced hearing loss; synovitis, tenosynovitis, and bursitis, and Raynaud's phenomena.

All other occupational illnesses: includes conditions such as, but not limited to anthrax, brucellosis, infectious hepatitis, malignant and benign tumors, food poisoning, histoplasmosis, coccidioidomycosis.
